

Off-Path TCP Hijacking in Wi-Fi Networks: A Packet-Size Side Channel Attack

Ziqiang Wang, Xuewei Feng, Qi Li, Kun Sun, **Yuxiang Yang**,
Mengyuan Li, Ganqiu Du, Ke Xu, Jianping Wu

Overview

Threat Model

Background

Attack Procedure

Empirical Study

Mitigation

Conclusion

Threat Model

Threat Model

✖ Consists of:

- A remote **server** that provides web services or SSH services
- An **AP** which provides Wi-Fi services and encrypts Wi-Fi frames with WPA2/WPA3
- A victim **client** who connects to Wi-Fi and establishes a TCP connection to the remote server
- An off-path **attacker** who connects to the same Wi-Fi network and does not have AP management privileges

✖ The attacker can:

- **Terminate** the victim's **TCP connection**
- **Inject** some malicious data to the **TCP connection**

Background

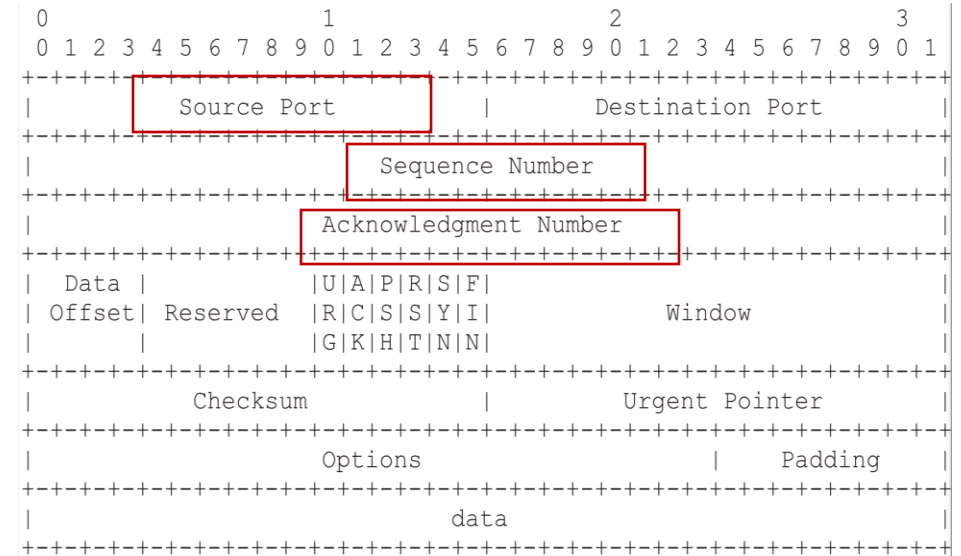

Off-Path TCP Hijacking Attacks

✂ Given a target server, the attacker already knows:

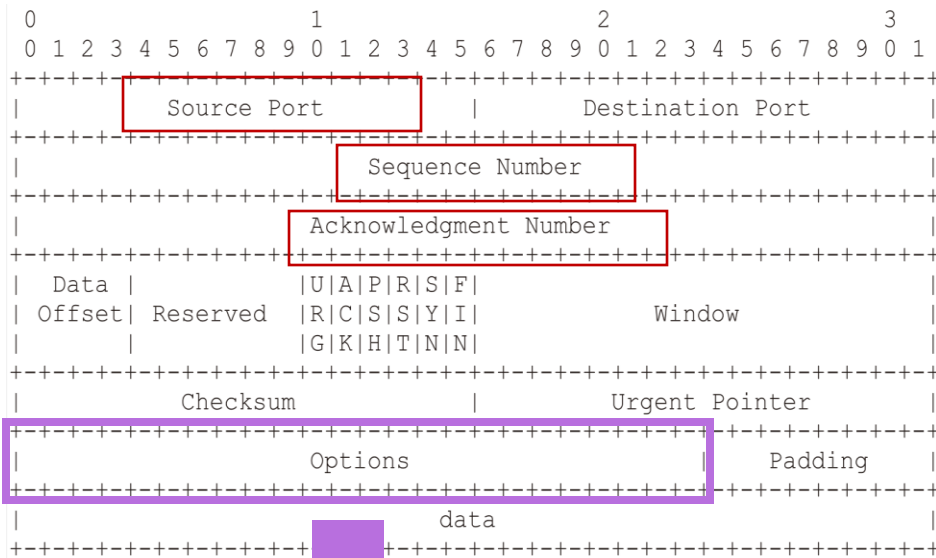

- Dst IP address: server IP
- Dst Port number: service at server (e.g. 80)

✂ The attacker still needs to know:

- **Src IP address:** client's IP
- **Src port number:** A random port at client
- **SEQ number:** Track data sequence based on an initial random number
- **ACK number:** Acknowledge data order using an initial random number

TCP Options

Timestamp: improve RTT measurement and prevent sequence wrap

SACK: enable efficient retransmission by acknowledging discontinuous data blocks

Packet type	TCP options		Packet size (Byte)	Frame size (Byte)
	Timestamp	SACK		
RST	-	-	54	56
ACK	+	-	66	68
SACK-ACK	+	+	78	80

+ represents carrying the option, while - represents not carrying the option.

The TCP packet size in IPv4

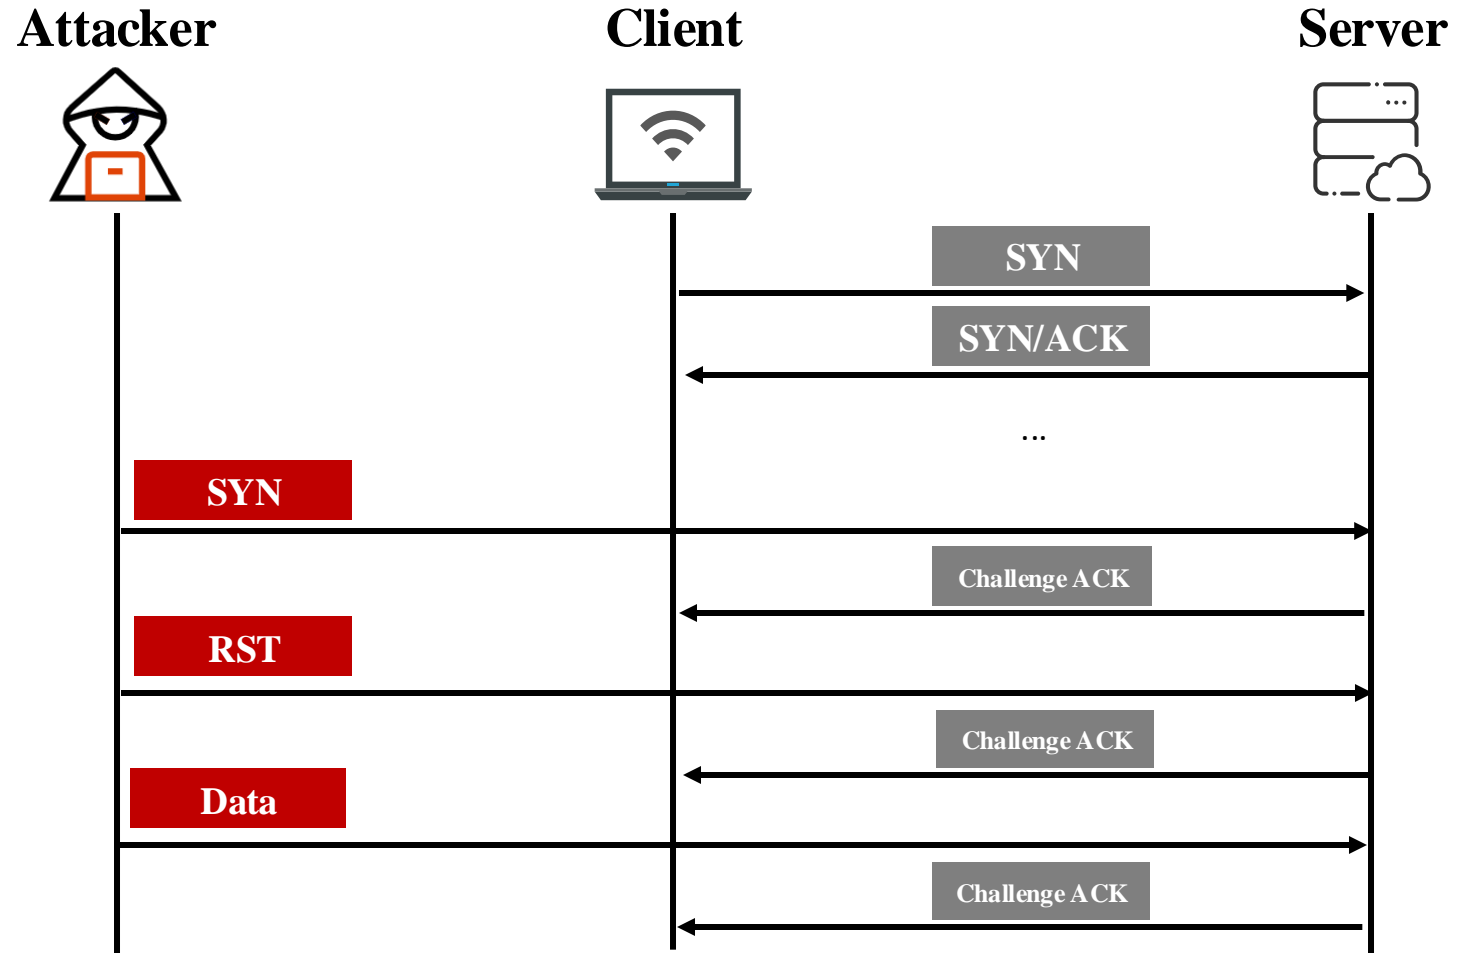

TCP options affect packet size

Challenge ACK Mechanism

❌ RFC 5961

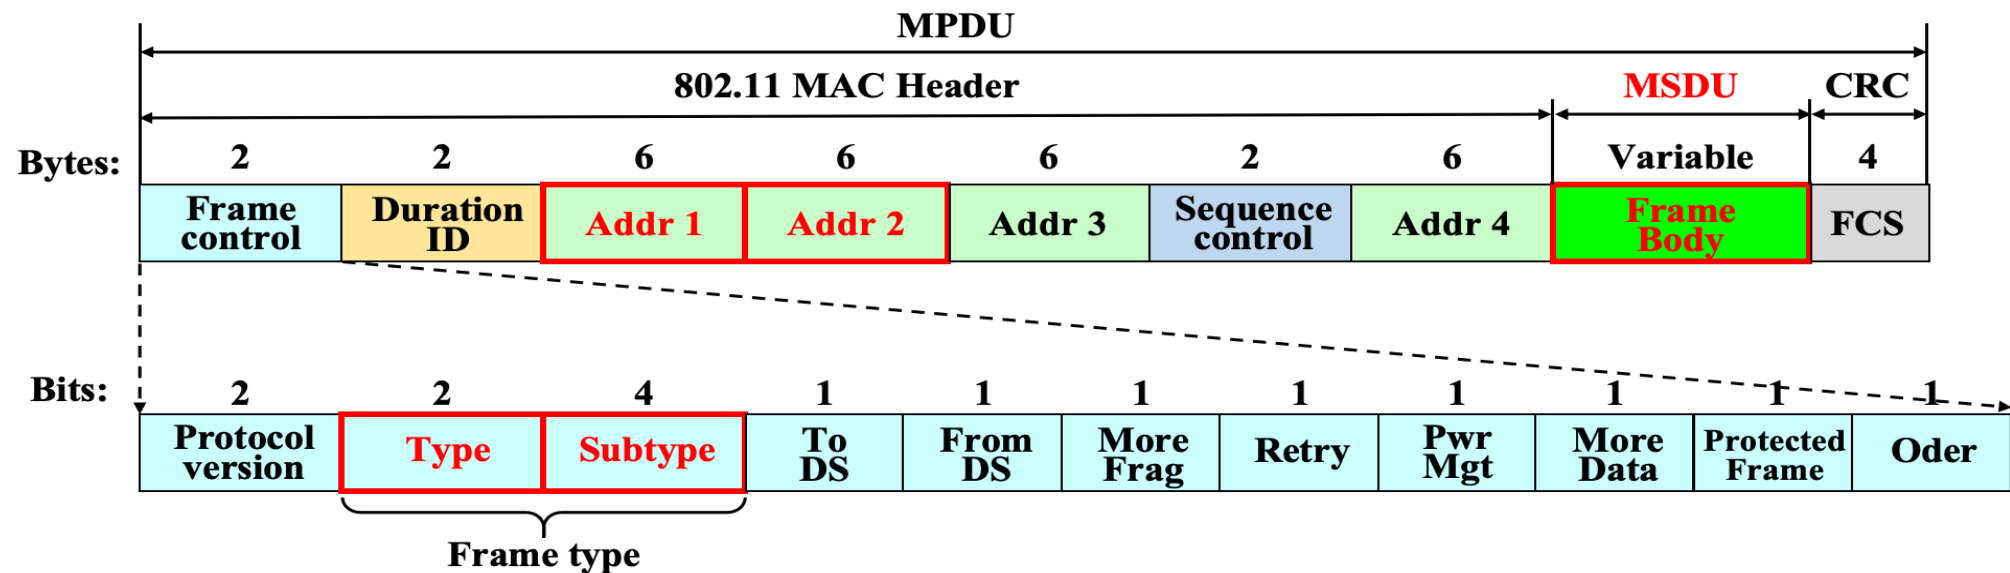

- SYN attack protection
- RST attack protection
- Data injection protection

**Utilized to elicit
diverse responses**

Wi-Fi Encryption and Frames

- The AP typically use WPA2/WPA3 to **encrypt users' Wi-Fi frames** at the link layer
- Attackers can only observe **unencrypted fields** (e.g., address and type) in the Wi-Fi frame header

ATTACK PROCEDURE

Attack Overview

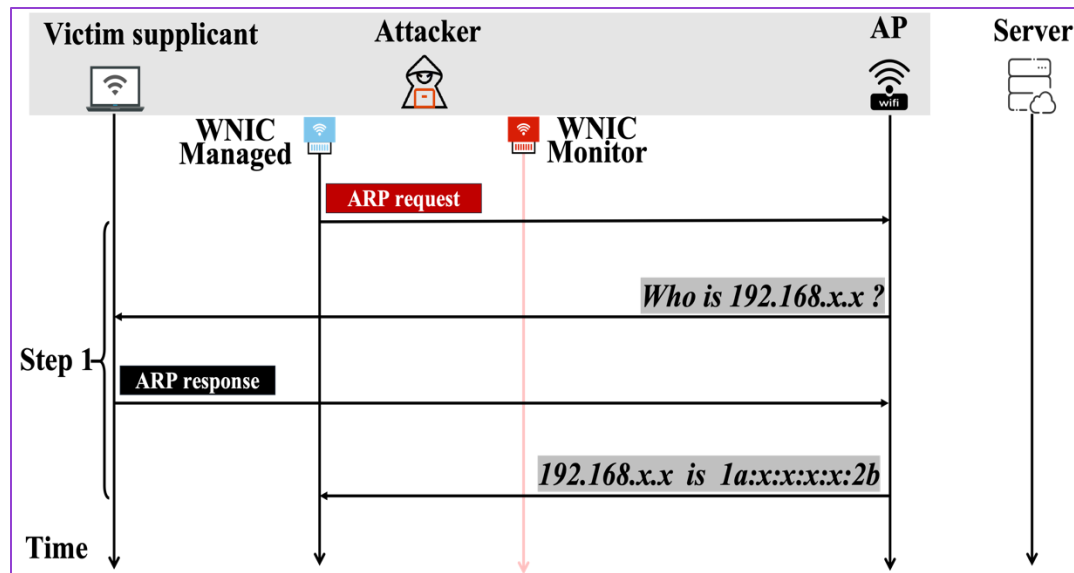

✂ Attack Steps:

- Step 1: Probing the Wi-Fi network (to get the **client's IP** address and **MAC** address)
- Step 2: Detecting active TCP connections (to infer the client's **source port** number)
- Step 3: Inferring sequence number (by exploiting **TCP SACK** options)
- Step 4: Inferring acknowledgment number (by exploiting **challenge ACK** mechanism)

Probing the Wi-Fi Network

✖ Identifying the client's MAC/IP addresses through **ARP request** or **DHCP mechanism**

ARP request

No.	Time	Source	Destination	Protocol	Length	Info
74	273769406	0.0.0.0	255.255.255.255	DHCP	332	DHCP Request
84	280933779	192.168.50.1	192.168.50.128	DHCP	342	DHCP ACK
61	21.767130764	0.0.0.0	255.255.255.255	DHCP	332	DHCP Request
62	21.771970320	192.168.50.1	255.255.255.255	DHCP	342	DHCP NAK
63	21.772122475	0.0.0.0	255.255.255.255	DHCP	332	DHCP Discover
64	21.77757366	192.168.50.1	192.168.50.104	DHCP	342	DHCP Offer
65	21.778266220	0.0.0.0	255.255.255.255	DHCP	338	DHCP Request

Dynamic Host Configuration Protocol (Offer)

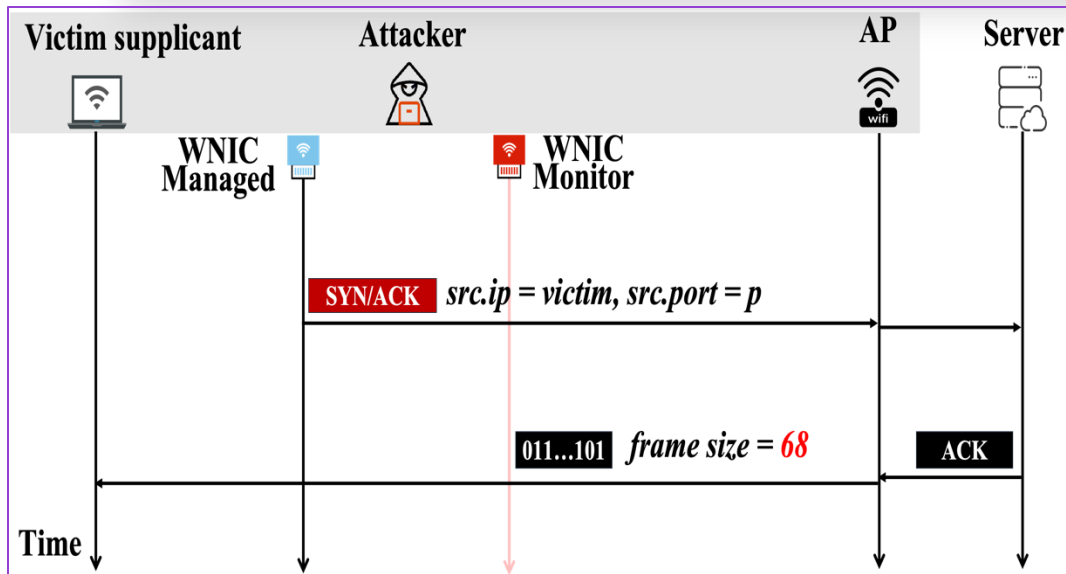

Message type: Boot Reply (2)
Hardware type: Ethernet (0x01)
Hardware address length: 6
Hops: 0
Transaction ID: 0x034169a0
Seconds elapsed: 1
Bootp flags: 0x0000 (Unicast)
Client IP address: 0.0.0.0
Your (client) IP address: 192.168.50.104 → Victim's IP address
Next server IP address: 192.168.50.1
Relay agent IP address: 0.0.0.0
Client MAC address: 70:ae:d5:3b:40:90 (70:ae:d5:3b:40:90) → Victim's MAC address
Client hardware address padding: 00000000000000000000
Server host name not given
Boot file name not given
Magic cookie: DHCP

DHCP mechanism (AP-isolated)

Inferring Source Port Number

- ✖ Sending **SYN/ACK** packets with **guessed source ports**
- ✖ Sniffing and **analyzing the sizes** of encrypted frames

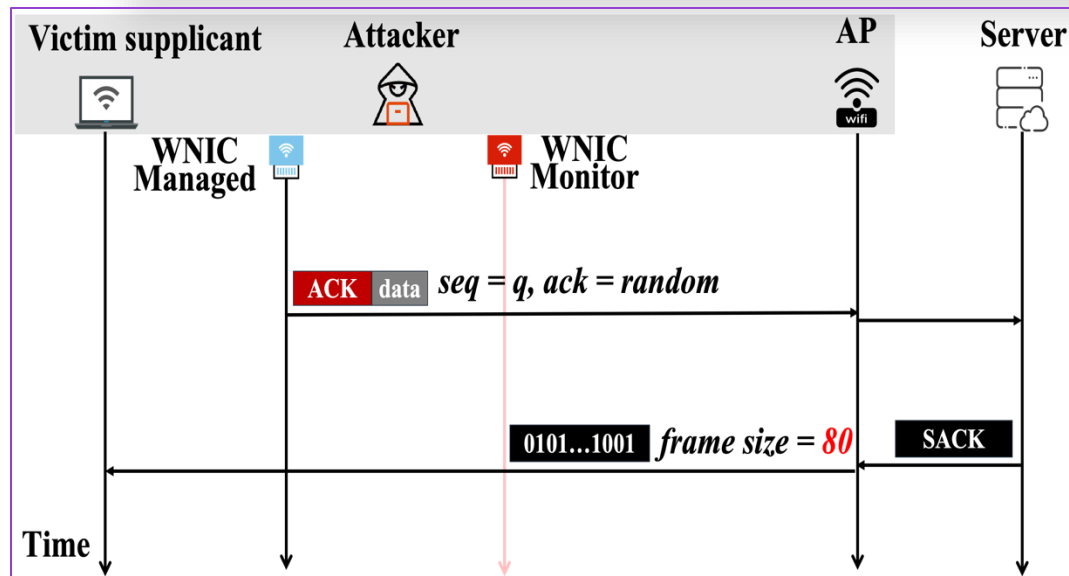

- Guess **the correct source port** number
- The server will respond with a **challenge ACK**
- ACK packet will carry with **timestamp option**
- Resulting in frame **size of 68**

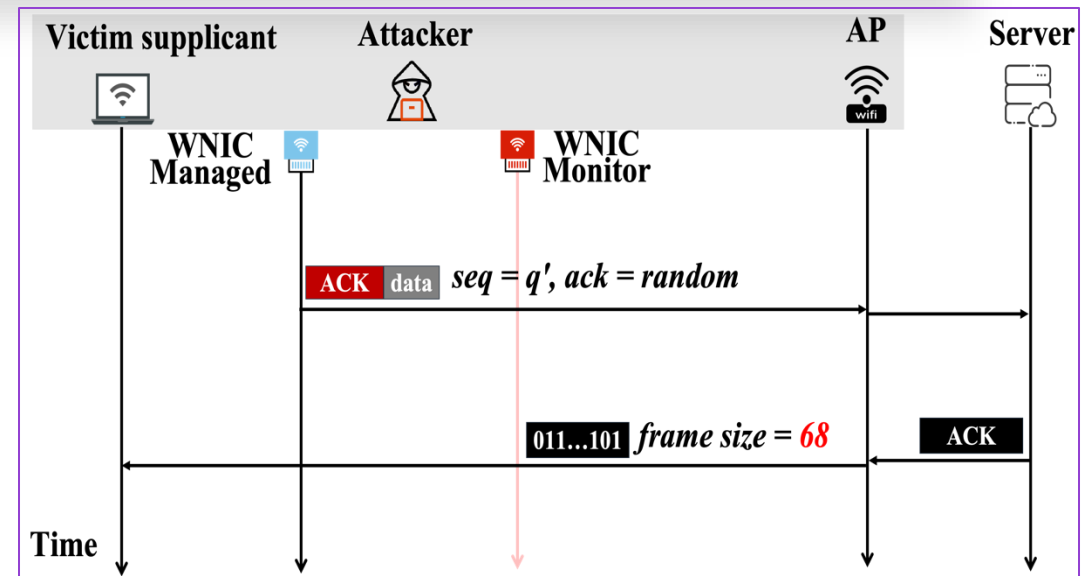

- Guess **an incorrect source port** number
- The server will respond with a **RST packet**
- RST packet will **not carry any option**
- Resulting in frame **size of 56**

Inferring Sequence Number

- ✖ Sending **ACK** packets with **guessed sequence numbers**
- ✖ Sniffing and **analyzing the sizes** of encrypted frames

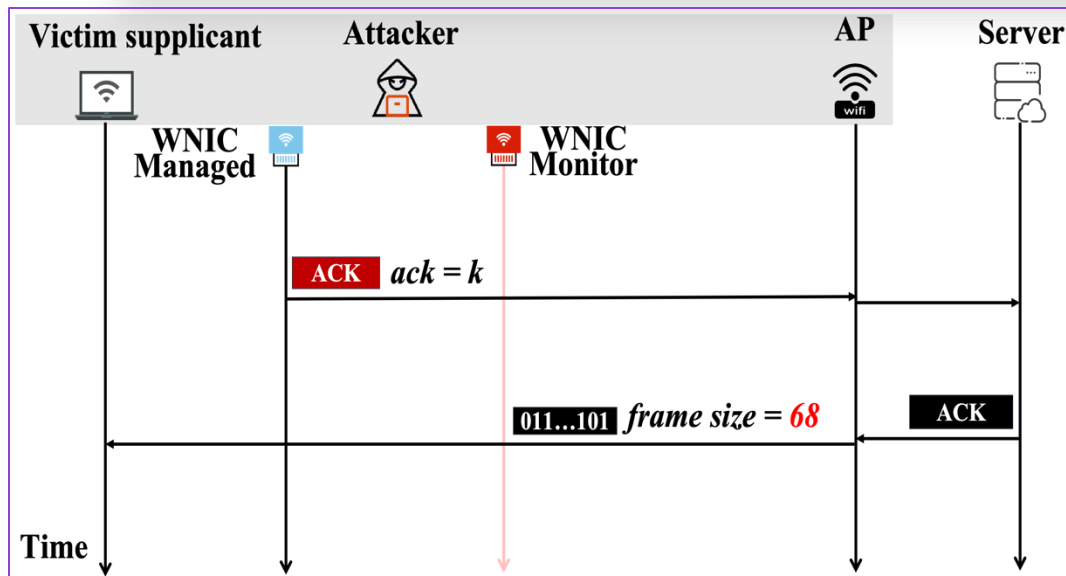

- Sequence number **less than** RCV.NXT
- The server will respond with a **SACK-ACK**
- Carry with **timestamp and SACK** option
- Resulting in frame **size of 80**

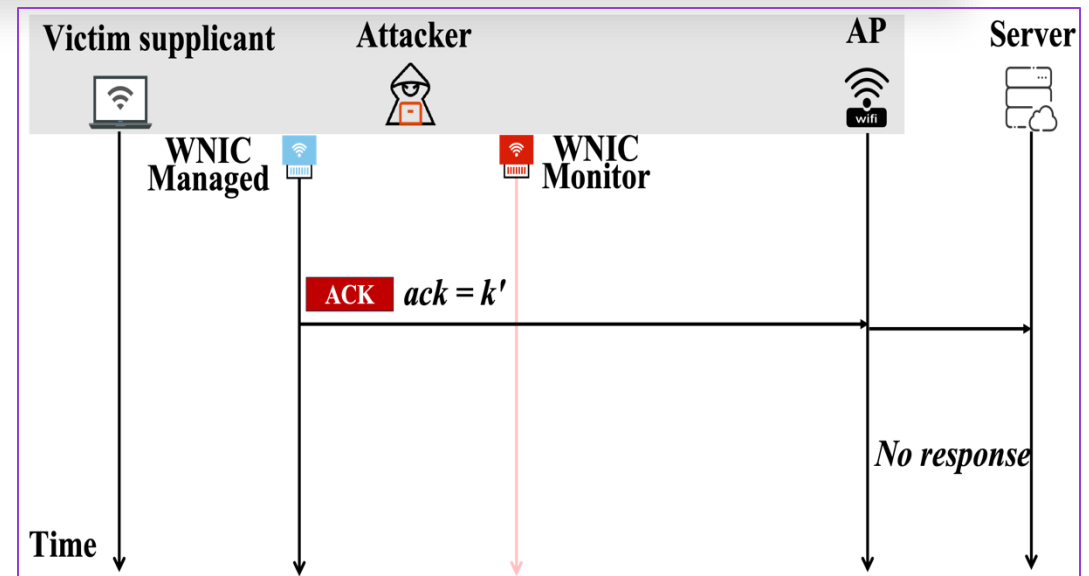

- Sequence number **greater than** RCV.NXT
- The server will respond with an **ACK**
- Carry with **only timestamp** option
- Resulting in frame **size of 68**

Inferring Acknowledgment Number

- ✖ Sending **ACK** packets with **guessed acknowledgment numbers**
- ✖ Sniffing and **analyzing the sizes** of encrypted frames

- Acknowledgment number **in window**
- The server will respond with an **ACK**
- Carry with **timestamp** option
- Resulting in frame **size of 68**

- Acknowledgment number **not in window**
- The server **will not respond**
- Resulting in **no frames**

Empirical Study

Analysis of Routers

✖ We perform tests on **30 mainstream wireless routers/APs** from **9 vendors**.

- Xiaomi, TP-LINK, HUAWEI
- ASUS, Tenda, Netgear
- Linksys, Ruijie, H3C

Frame size side channel
found in all routers

Router	Generation	WPA	IPv6 Enabled	Vendor	Built-in Firewall	Anti-Flooding	MAC-ADDR Filtering

○ indicates that the security mechanism is not supported by the router, while ● indicates that it is supported.

Details of tested wireless routers/APs

Attack Evaluation

🔧 SSH DoS Attack:

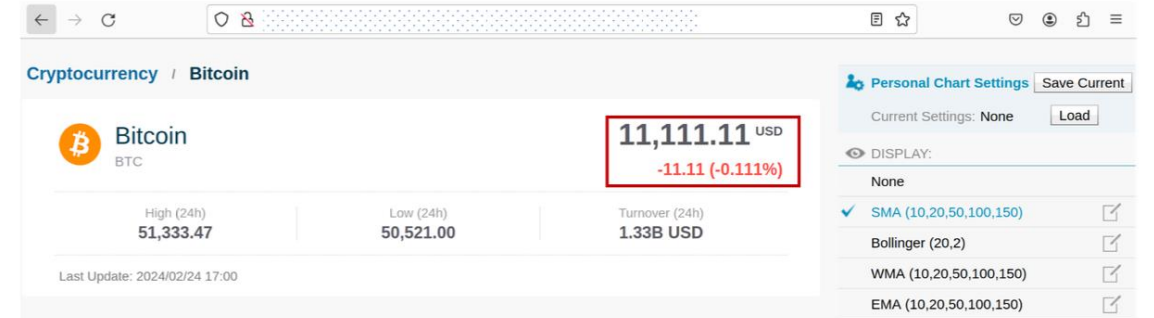

- Success rate: 84%
- Attack time: ~19s

🔧 HTTP Injection Attack:

- Success rate: 72%
- Attack time: ~28s

Server address	Linux version	Time cost (s)	Bandwidth cost (KB/s)	Success rate
82.x.x.41	5.4	18.47	77.04	8/10
150.x.x.186	5.15	19.56	80.91	9/10
43.x.x.151	5.10	18.24	69.15	8/10
43.x.x.84	4.15	17.26	68.18	8/10
43.x.x.187	3.13	20.12	82.07	9/10

SSH DoS Attack

HTTP Injection Attack

Real-World Attacks

- ✖ We conduct thorough experiments of the attack in **80 various real-world Wi-Fi networks**
- ✖ We take two case studies of attacks on **SSH and HTTP** applications and measure the success rate of each attack

No.	SSID	AP Vendor	IPv4/IPv6	PHY model	AP isolation	Wi-Fi channel	SSH DoS	Web hijack

🕒 means IPv4 only and 🕒 means both IPv4 and IPv6 are supported.

Experimental Results of TCP Attacks in the Wi-Fi Networks.

Real-World Attacks

✂ **75 out of 80** Wi-Fi networks
are **vulnerable** to our attack

✂ The attack **failed** in **5 WiFi**
networks

- AP isolation
- Reverse path validation

Analysis of 80 real-world WiFi networks

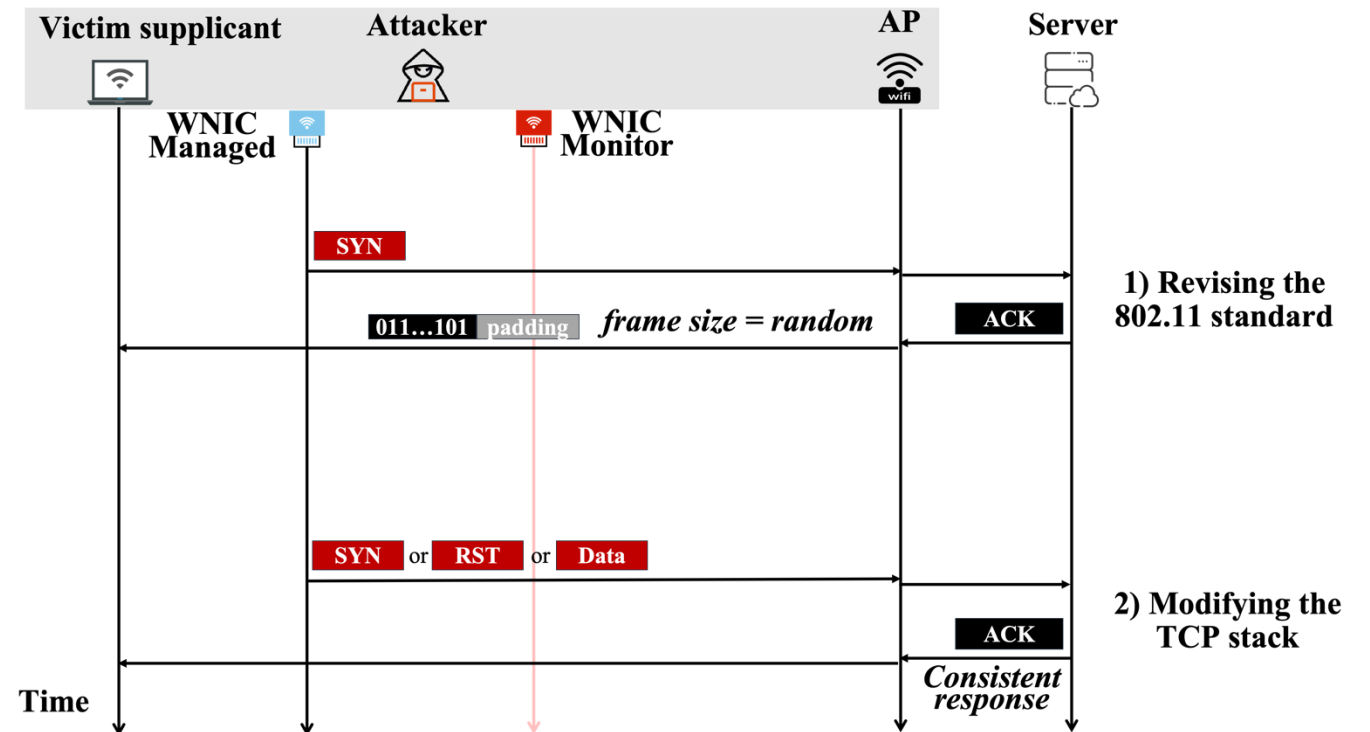

Mitigation

Mitigation

✖ Revising the **802.11 standard** to support random padding for encrypted frame sizes

✖ Modifying the **TCP protocol stack** to ensure consistent response

Conclusion

- ✘ Uncovered a new side-channel (i.e., the encrypted frame size) in Wi-Fi networks to **attack TCP connections**
- ✘ Performed an **extensive investigation** against popular AP routers and real-world Wi-Fi networks
- ✘ Suggested **defense countermeasures**
