Memory corruption vulnerabilities lead to Control Flow Hijacking

Control Flow Integrity

CFIs prevent redirection of **control flow** to arbitrary locations

- CFIs can protect:
 - **Forward edges** (*calls, jumps*)
 - **Backward edges** (*return addresses*)

- Statically determined **set of valid targets** for a call

- CFIs can protect:
 - **Forward edges** (*calls, jumps*)
 - **Backward edges** (*return addresses*)
- Statically determined set of valid targets for a call

Undecidable!

- Resort to **approximations** of such sets:
 - **Coarse** grained (*single valid target set*)
 - **Fine** grained (*valid target set per call site*)

- Control Flow Integrity
- **Microsoft Control Flow Guard**
- BATE: Bypassing CFG
- Impact Evaluation
- Conclusions

- **Coarse Grained CFI mechanism**
 - *Deployed in Microsoft Windows since Windows 8.1*
(500 million machines worldwide)
 - Compile time → *valid target table* for **any** indirect branch

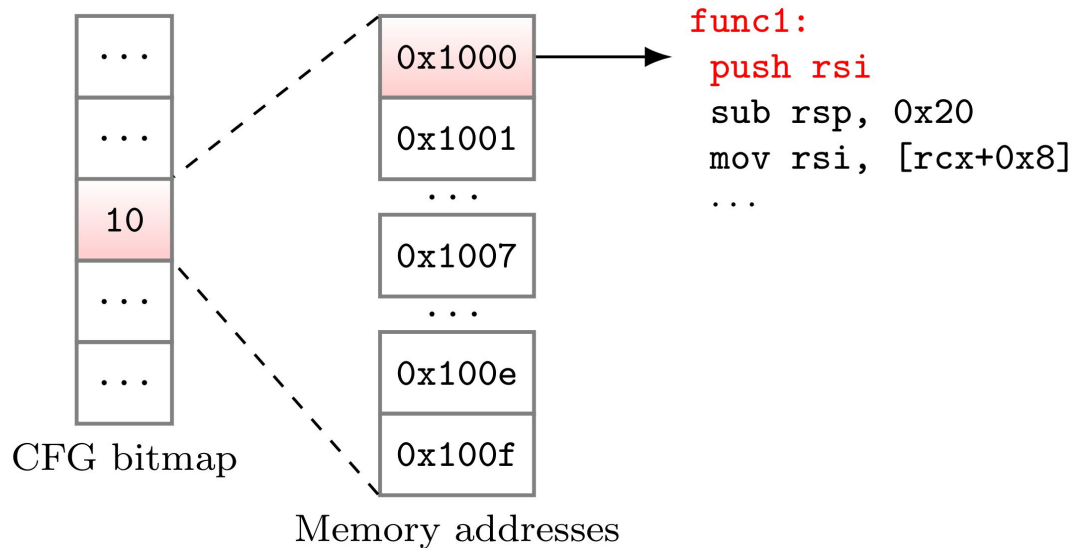

- **Coarse Grained CFI mechanism**
 - *Deployed in Microsoft Windows since Windows 8.1*
(500 million machines worldwide)
 - Compile time → *valid target table* for **any** indirect branch
 - Module loading → *CFG bitmap* for **16-byte aligned ranges**

Control Flow Guard - Overview

10: Aligned valid target

Control Flow Guard - Overview

00: No valid target

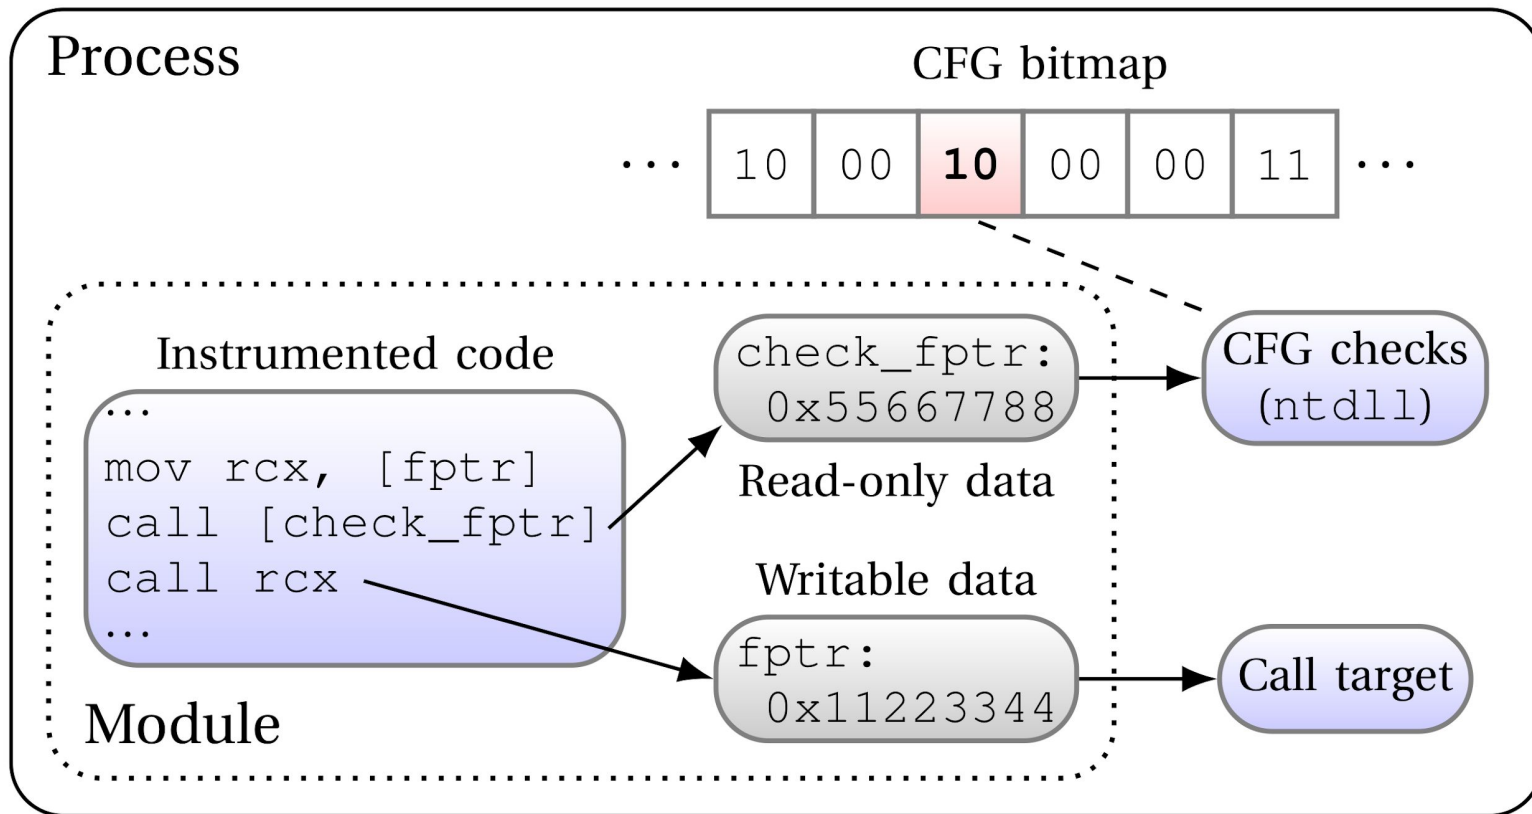

Control Flow Guard - Overview

11: Unaligned Valid Target

Control Flow Guard - Runtime

- Control Flow Integrity
- Microsoft Control Flow Guard
- **BATE: Bypassing CFG**
- Impact Evaluation
- Conclusions

- Multiple issues
 - **Unaligned targets**
 - No backwards-edge CFI
 - Process-wide bitmap

- Multiple issues
 - **Unaligned targets**
 - No backwards-edge CFI
 - Process-wide bitmap

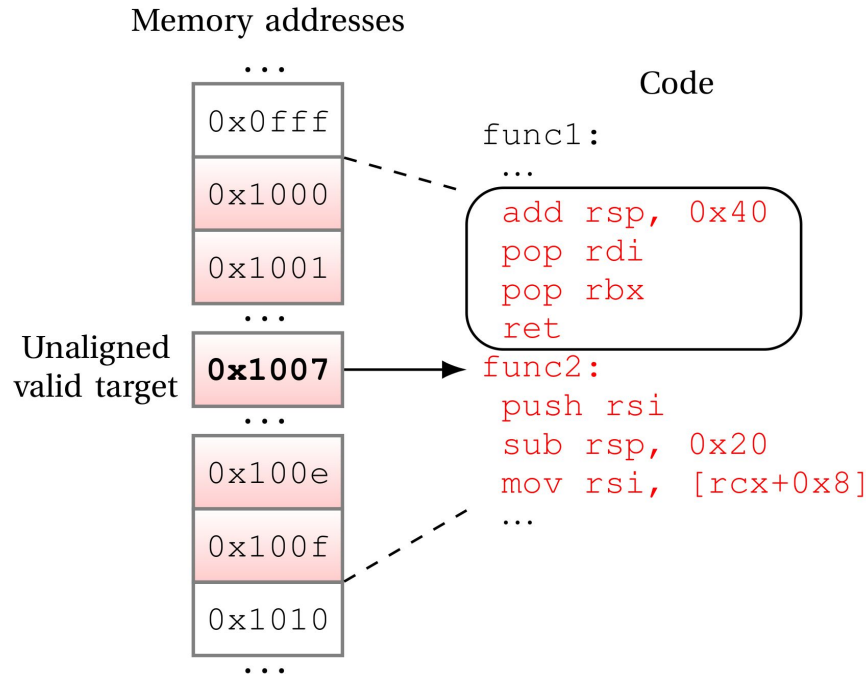

- Functions are made of three parts
 - Prologue (*allocate stack, save registers*)
 - Body
 - **Epilogue** (*deallocate stack, restore registers, return*)

Unaligned Function Epilogues

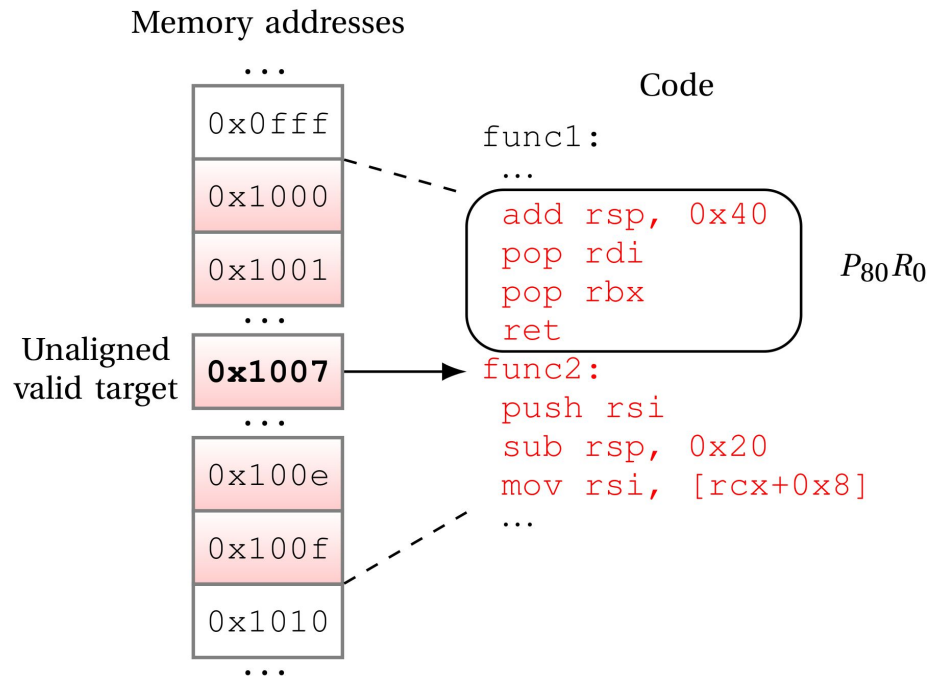

Unaligned targets allow us to reach epilogues

- Increment stack pointer

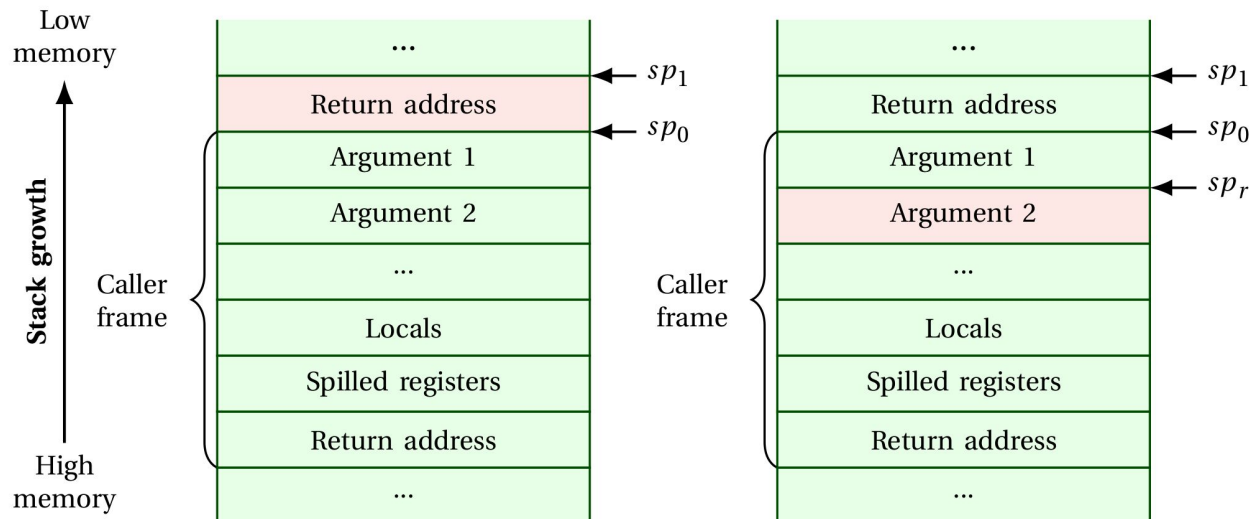

Define PR gadgets

- Increment stack pointer by P bytes **before** returning
- Increment stack pointer by R bytes **after** returning

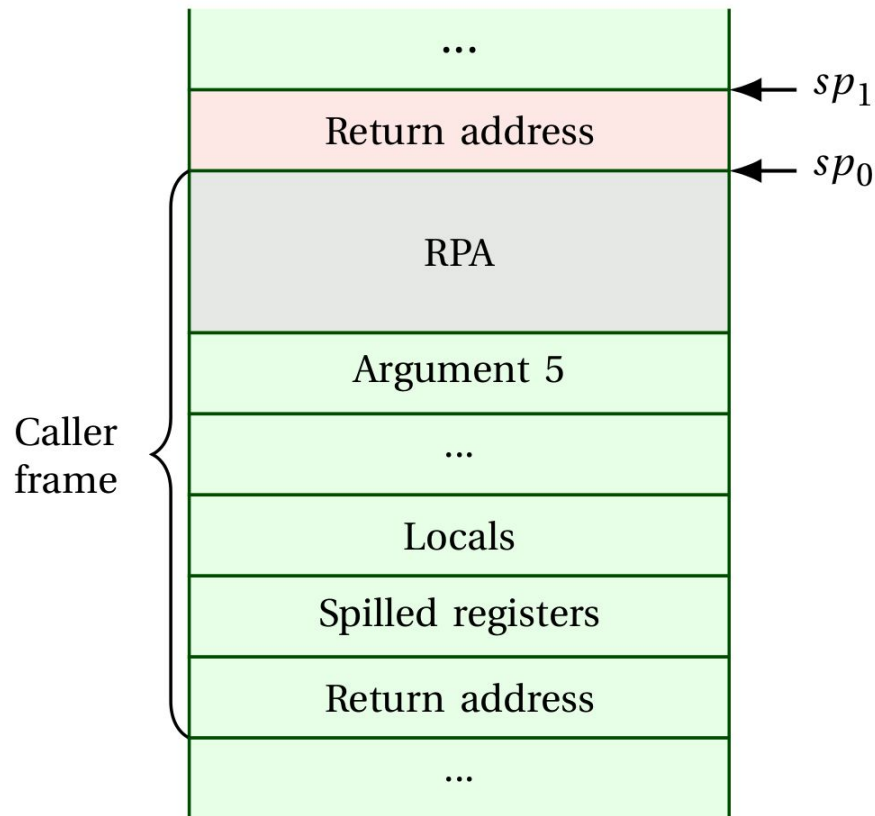

Hijack execution to a PR gadget to **pivot** the stack

Return address into attacker-controlled data
No backwards-edge CFI

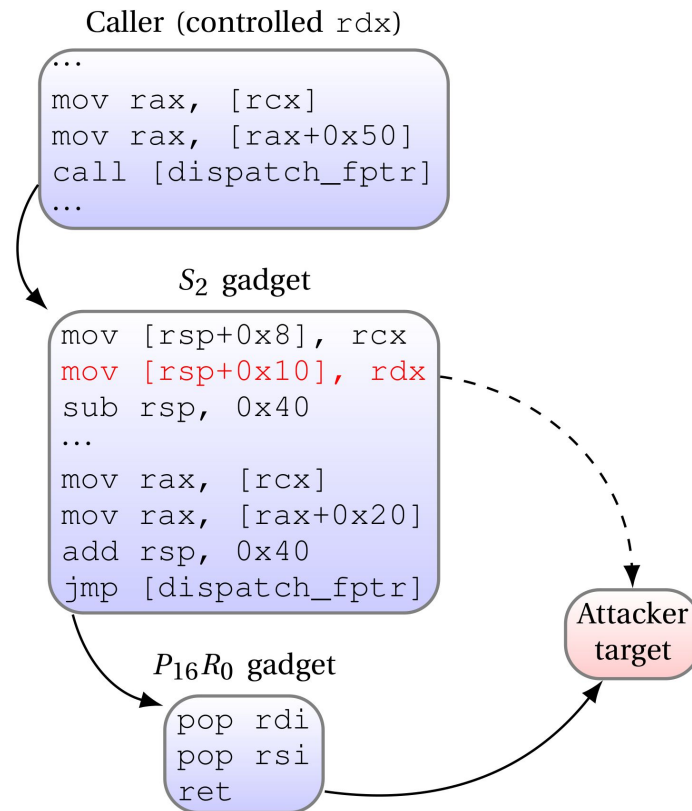

Problem: on **64-bit**, stack control is harder

- First 4 arguments passed in registers
- *Register Parameter Area* at stack top

Solution: **spill** argument registers to stack

- **S** gadgets
- Chain S gadget - PR gadget

- Control Flow Integrity
- Microsoft Control Flow Guard
- BATE: Bypassing CFG
- **Impact Evaluation**
- Conclusions

- Systematically evaluated Windows' **system libraries**
 - Loaded by a **large number** of processes

	PR	S
32-bit	57	-
64-bit	22	985

- Systematically evaluated Windows' **system libraries**
 - Loaded by a **large number** of processes
- Found PR and S gadgets in **high-risk libraries**
 - **C runtime** (32-bit)
 - Media codecs
 - Script engines

	PR	S
32-bit	57	-
64-bit	22	985

- Control Flow Integrity
- Microsoft Control Flow Guard
- BATE: Bypassing CFG
- Impact Evaluation
- **Conclusions**

- **Coarse grained 16-byte approximation by CFG**
 - Well-performing practical design
 - **Very strong assumptions** (\rightarrow *alignment*) do not hold
- BATE: High impact attack
 - **Widespread** gadgets
 - General, allows us to **bypass CFG entirely**
 - Feasible in practice
- **Disclosed** to Microsoft
 - Will be mitigated in RS4 (March/April)
 - We have permission to present this work

Thanks!

And align your code :-)

Backup Slides

- Gadget Stitching (*Davi et al., 2014*)
 - Chains of CFI-allowed gadgets
- Counterfeit Object-Oriented Programming (*Schuster et al., 2015*)
 - Chains of CFI-allowed virtual methods

Both draw from **restricted gadget sets**

- Writing chains is harder
- BATE enables unrestricted code reuse

More gadgets?!

- Systematically evaluated Microsoft **Office 2016 Suite**
 - Exposed to attacks (e.g., macros on received documents)
 - 64-bit version

- **123 PR gadgets**

- Of which 101 are interesting: $P_{40}R_0$

Aligning targets

- Simple
- May be difficult in corner cases (e.g., handwritten assembly)
- May impact certain optimizations

Making CFG more precise

- Virtual addressing space limitations
- CFG redesign?

PoC exploit for 64-bit Edge on Windows 10

- Based on CVE-2017-720{0,1}
- **Remote code execution** from JavaScript
- MPEG-2 media codec by embedding a video
