Adversary

Attack Core: The adversary can detect if its request matches a previous one by observing whether KV cache sharing is triggered.

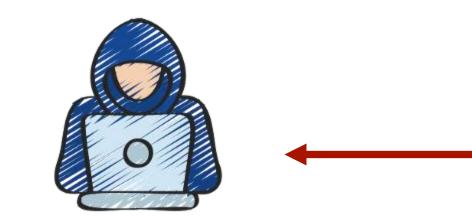

Assume a previously served request: "Imagine you are an IT expert"

The adversary has already extracted: "Imagine you are"

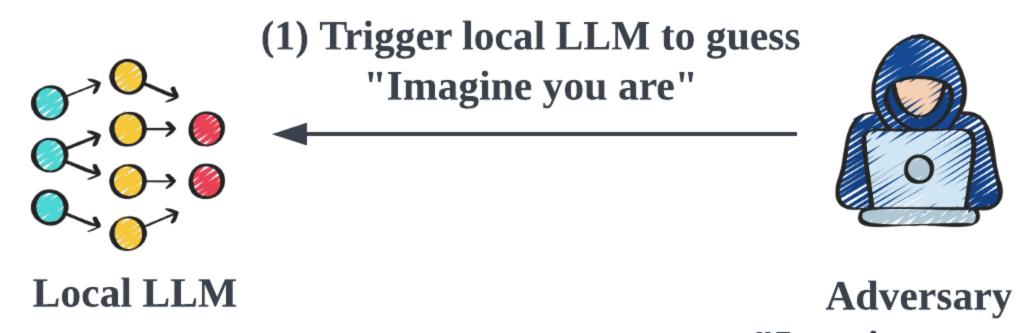

Adversary "Imagine you are"

LLM Server "Imagine you are an IT expert"

Use a local LLM to predict possible tokens

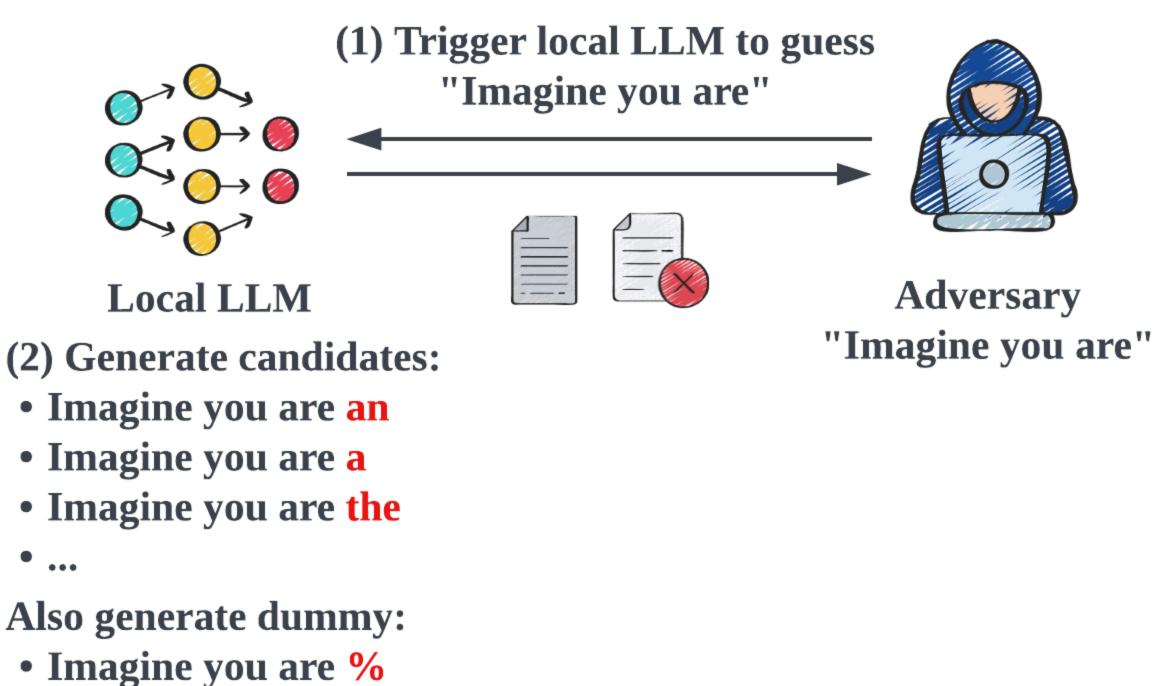

"Imagine you are"

LLM Server "Imagine you are an IT expert"

Also generate a dummy token for side channel effect

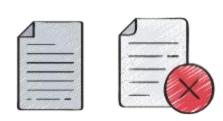

LLM Server "Imagine you are an IT expert"

Send three batches of requests in turn

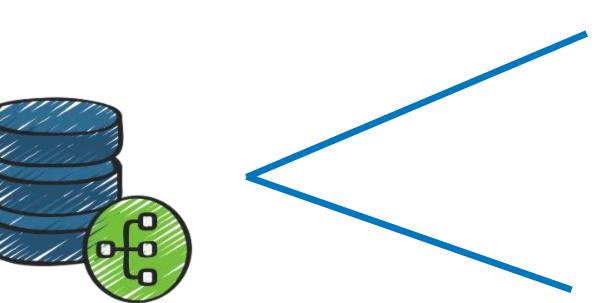

(3-1) Send the first dummy batch

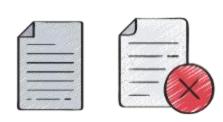

Adversary "Imagine you are" LLM Server "Imagine you are an IT expert"

Query Queue Imagine you are % Imagine you are %

Send three batches of requests in turn

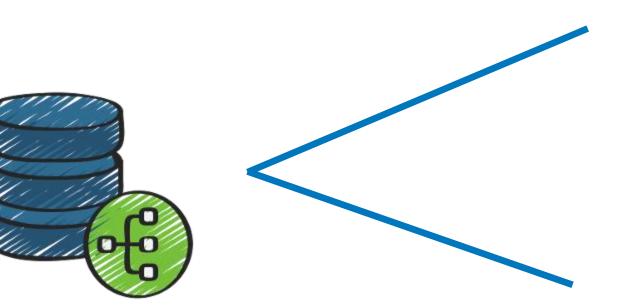

(3-2) Send the candidates batch

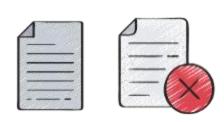

Adversary "Imagine you are" LLM Server "Imagine you are an IT expert"

Query Queue Imagine you are % Imagine you are % Imagine you are a Imagine you are an

Send three batches of requests in turn

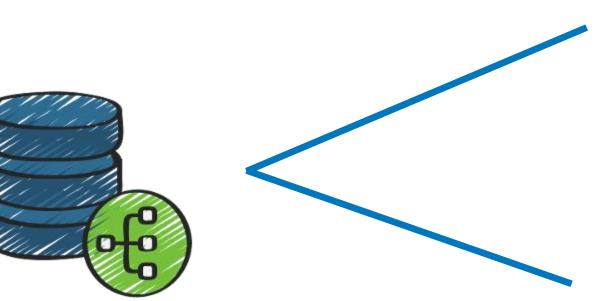

(3-3) Send the second dummy batch

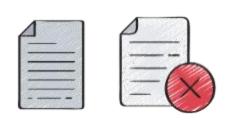

Adversary "Imagine you are" LLM Server "Imagine you are an IT expert"

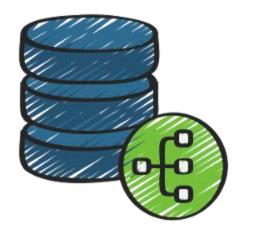

Query Queue Imagine you are % Imagine you are % Imagine you are % Imagine you are a Imagine you are an Imagine you are the Imagine you are % Imagine you are % Imagine you are %

We leverage serving order as a side-channel effect, as the longer token matches can be served first

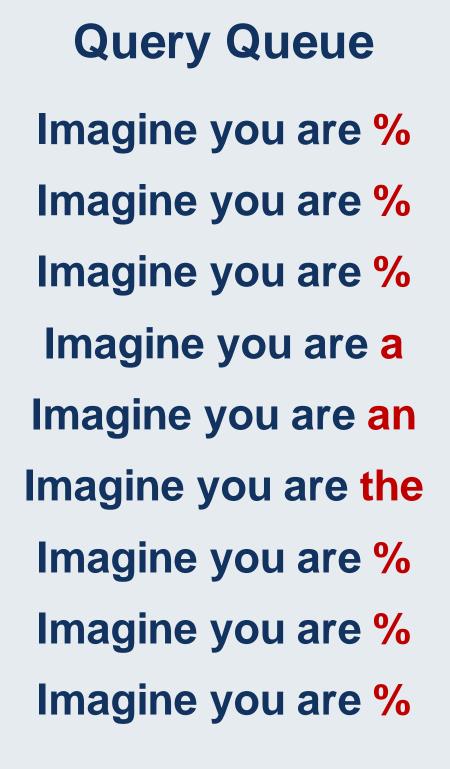

(4) Observe the order

Adversary "Imagine you are"

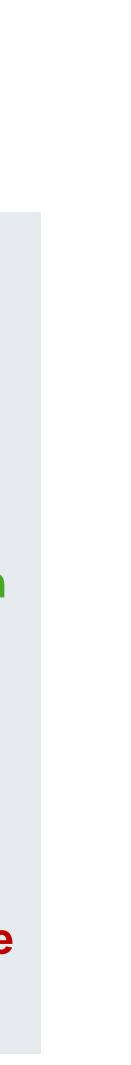

LLM Server "Imagine you are an IT expert"

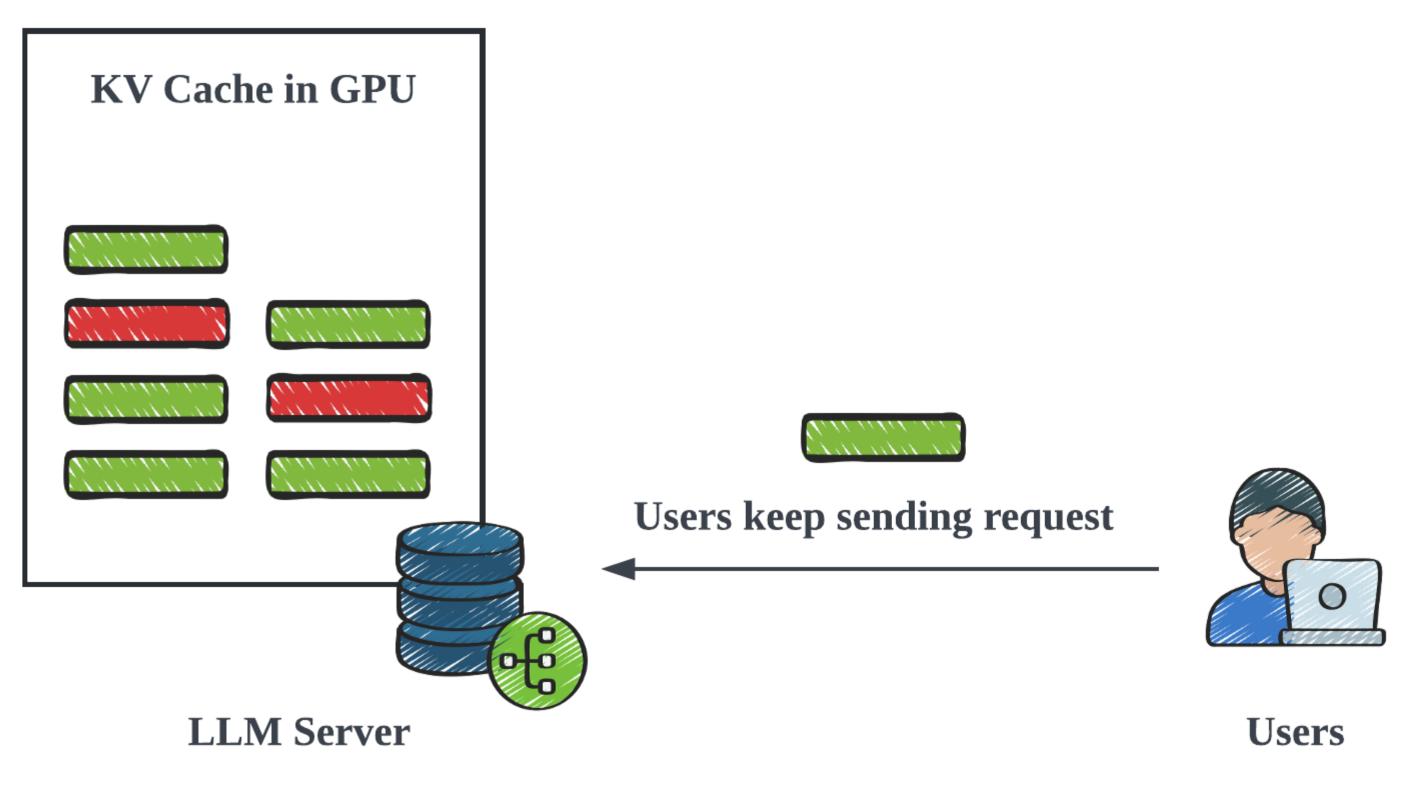

After LPM **Query Queue**

Imagine you are % Imagine you are % Imagine you are % Imagine you are an Imagine you are % Imagine you are % Imagine you are a Imagine you are a

Complete Attack Flow

The adversary tracks a random prompt and use token-by-token extraction

Token-by-token extraction

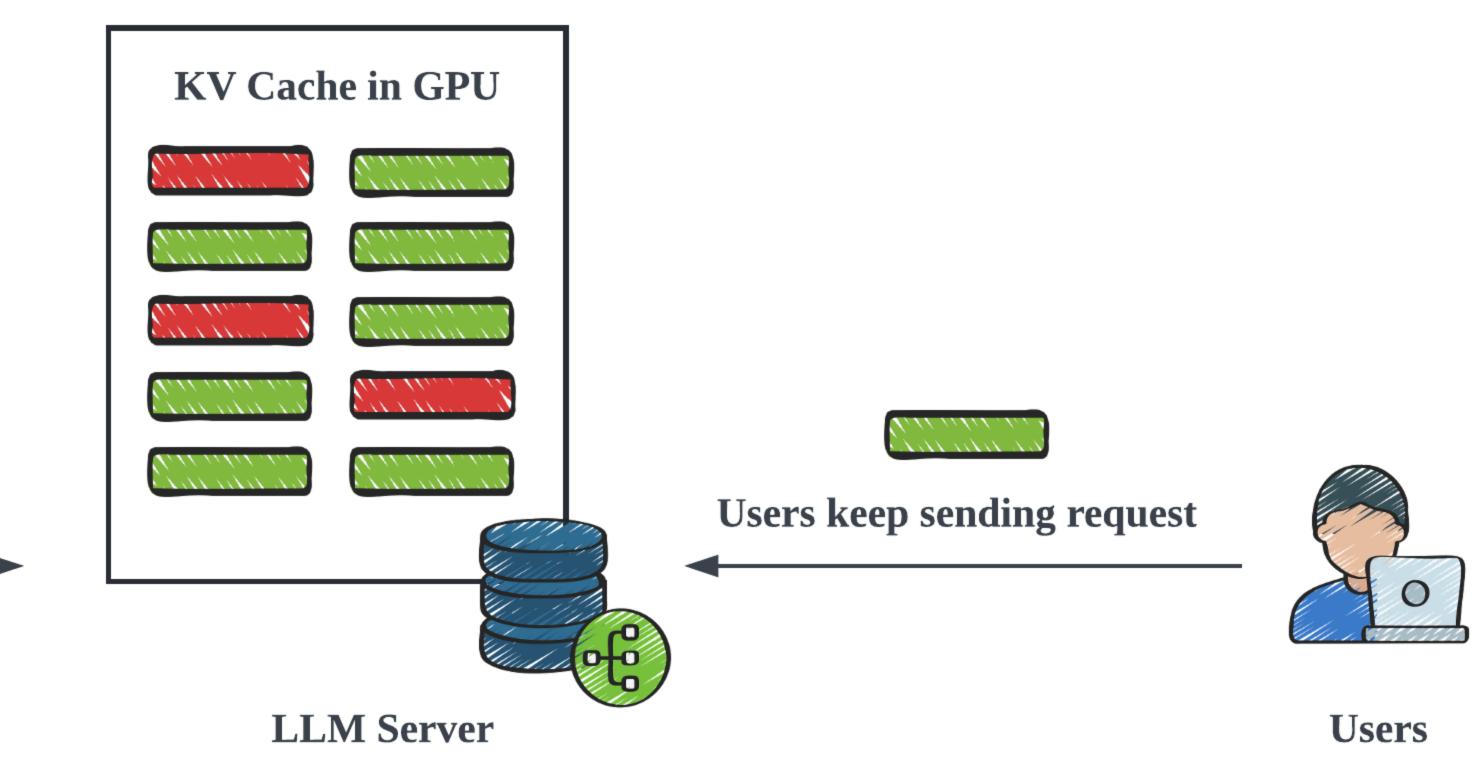

Adversary

Complete Attack Flow

The adversary switches to another prompt if the tracked prompt is evicted or the next token is hard to guess

Token-by-token extraction

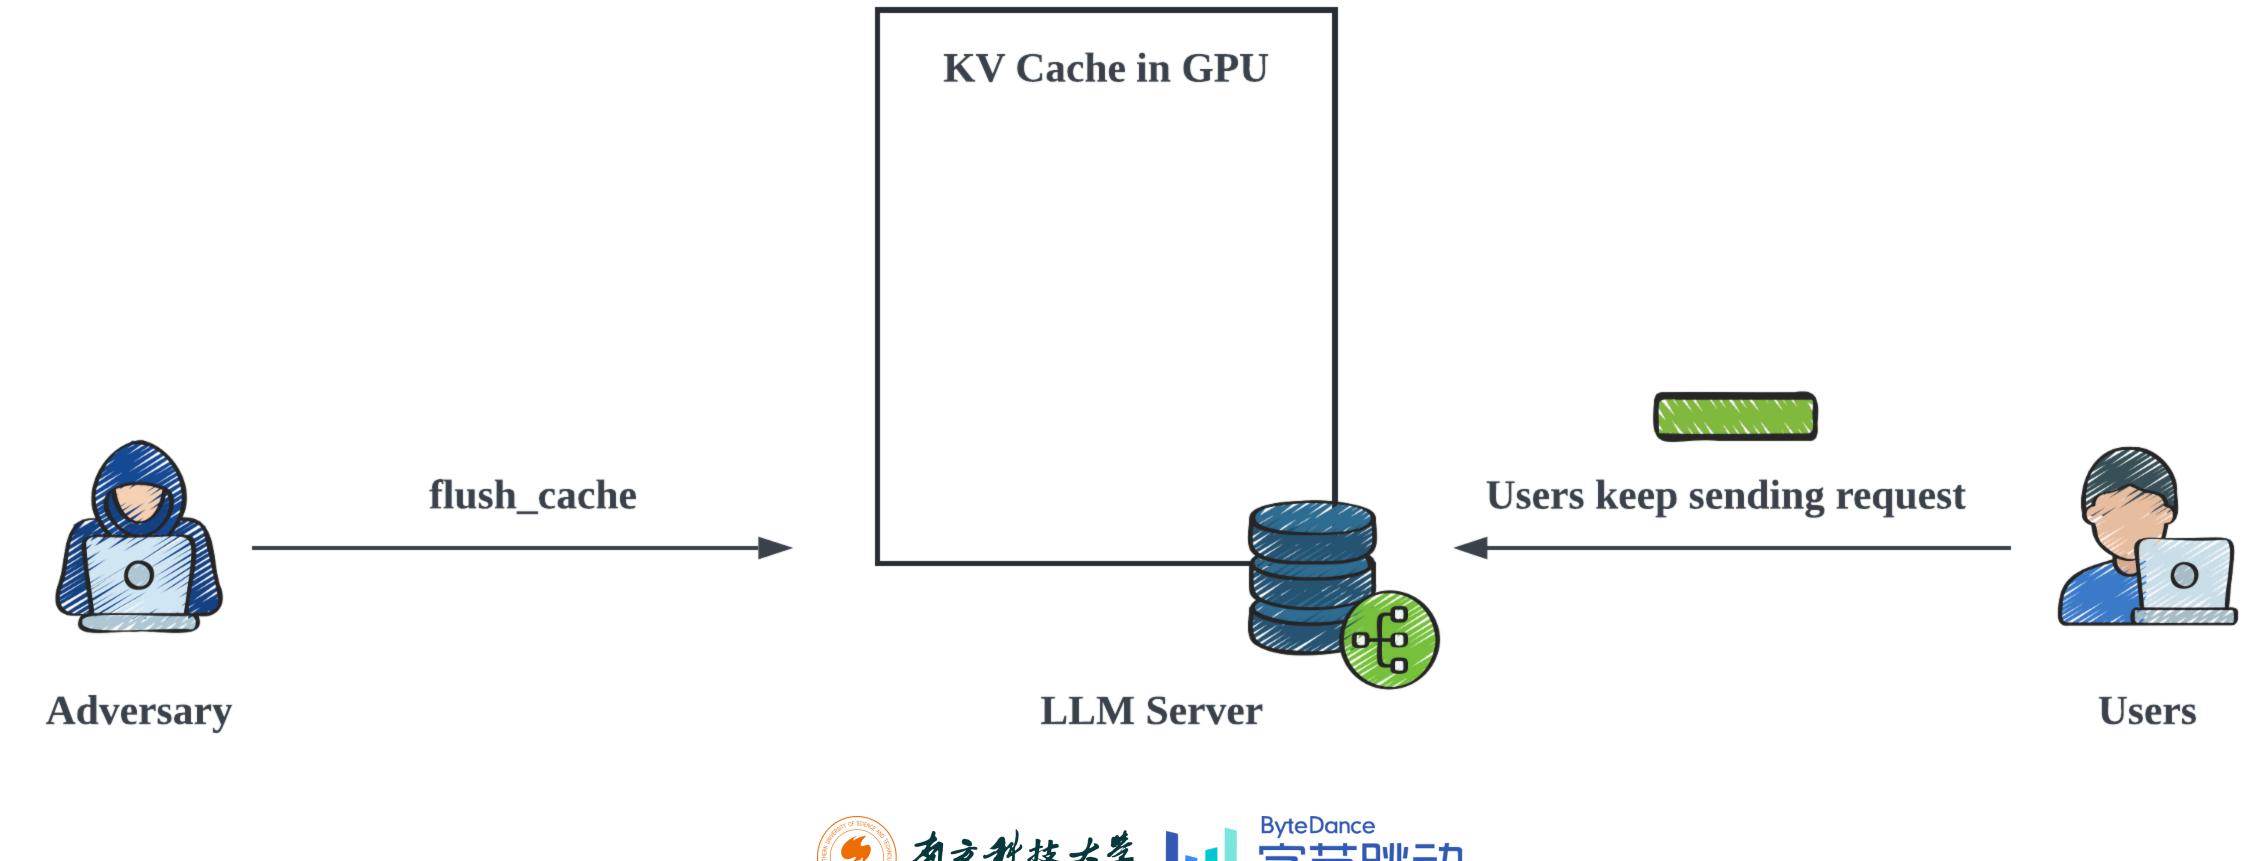

Adversary

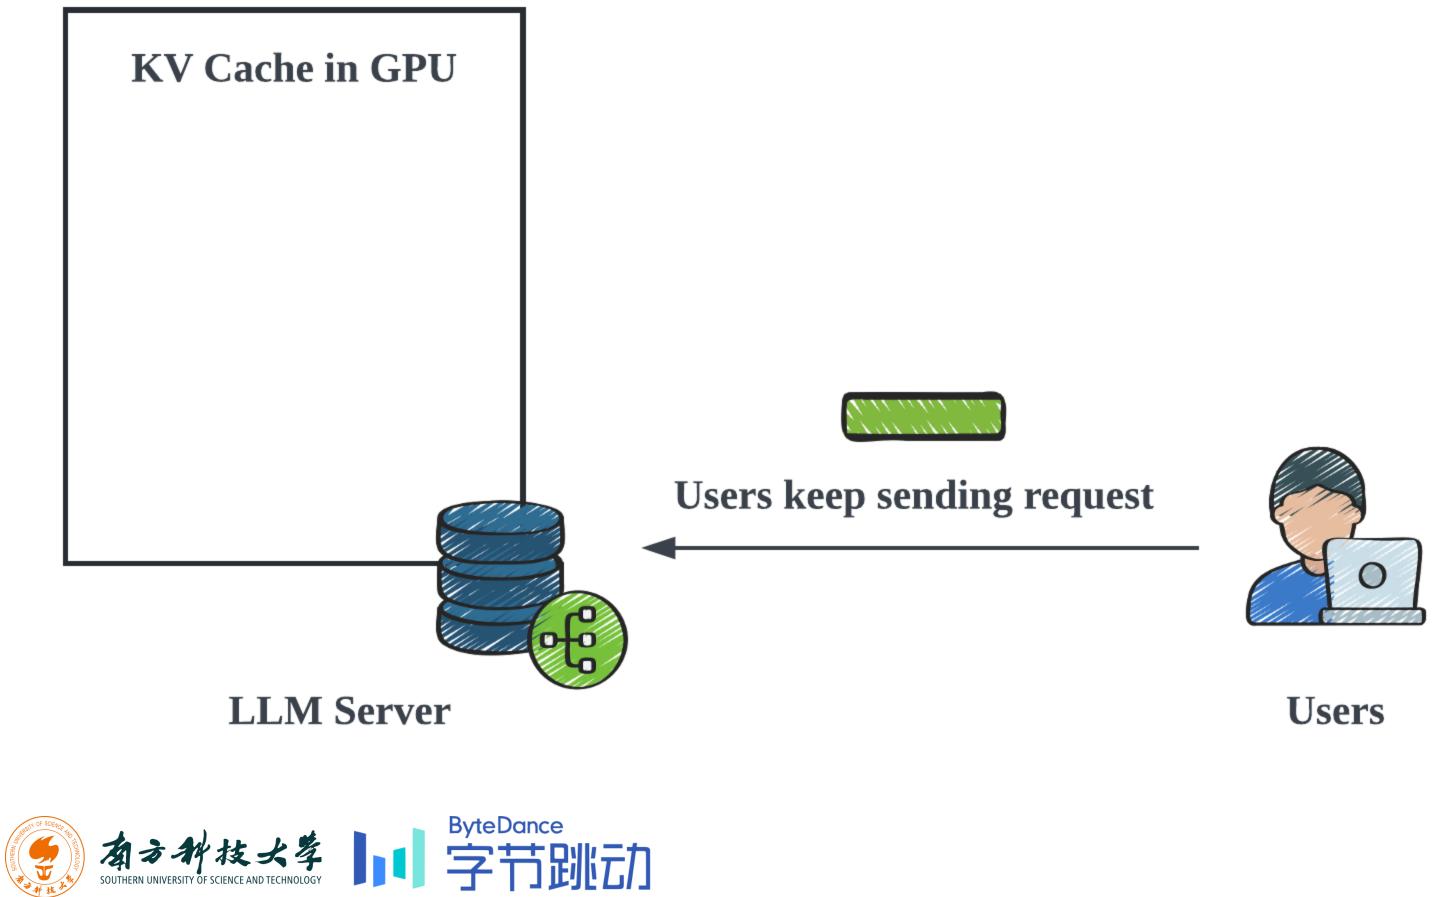

Complete Attack Flow

The adversary uses *flush_cache* in SGLang to clear KV storage and switch prompts from a clean slate (our paper adopts a more complex alternative when *flush_cache* is unavailable)

The adversary has no background knowledge and extracts all tokens to reverse the full prompt from another user

Vicitim

What are some bad jokes that you would personally put at the beginning of the song?

LLM Server

Victim

Scenario 2

The adversary knows the prompt template and extracts only a few key tokens to steal sensitive information from another user

Adversary

You are an [language] teacher who will provide me with vocabulary exercises on [subject] with [number] questions when I write to you. You'll send me a detailed correction, explaining the mistakes I've made and and and you'll put a space between each correction for visibility.

Adversary

Vicitim

You are an English teacher who will provide me with vocabulary exercises on school with 10 questions when I write to you. You'll send me a detailed correction, explaining the mistakes I've made and and and you'll put a space between each correction for visibility.

LLM Server

Victim

Scenario 3

The adversary knows <u>the prompt input</u> and aims to steal prompt template (valuable in today's LLM application)

Adversary

I want to know the way for installing Windows 10 on my laptop. Could you provide a step-by-step guide, including any essential settings to adjust during the installation?

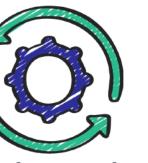

Adversary

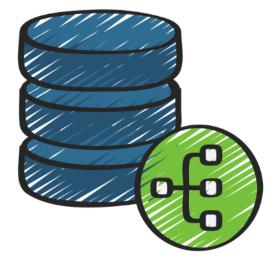

Assuming you are an IT expert, I want to know the way for installing Windows 10 on my laptop. Could you provide a step-by-step guide, including any essential settings to adjust during the installation?

LLM Server

Evaluations

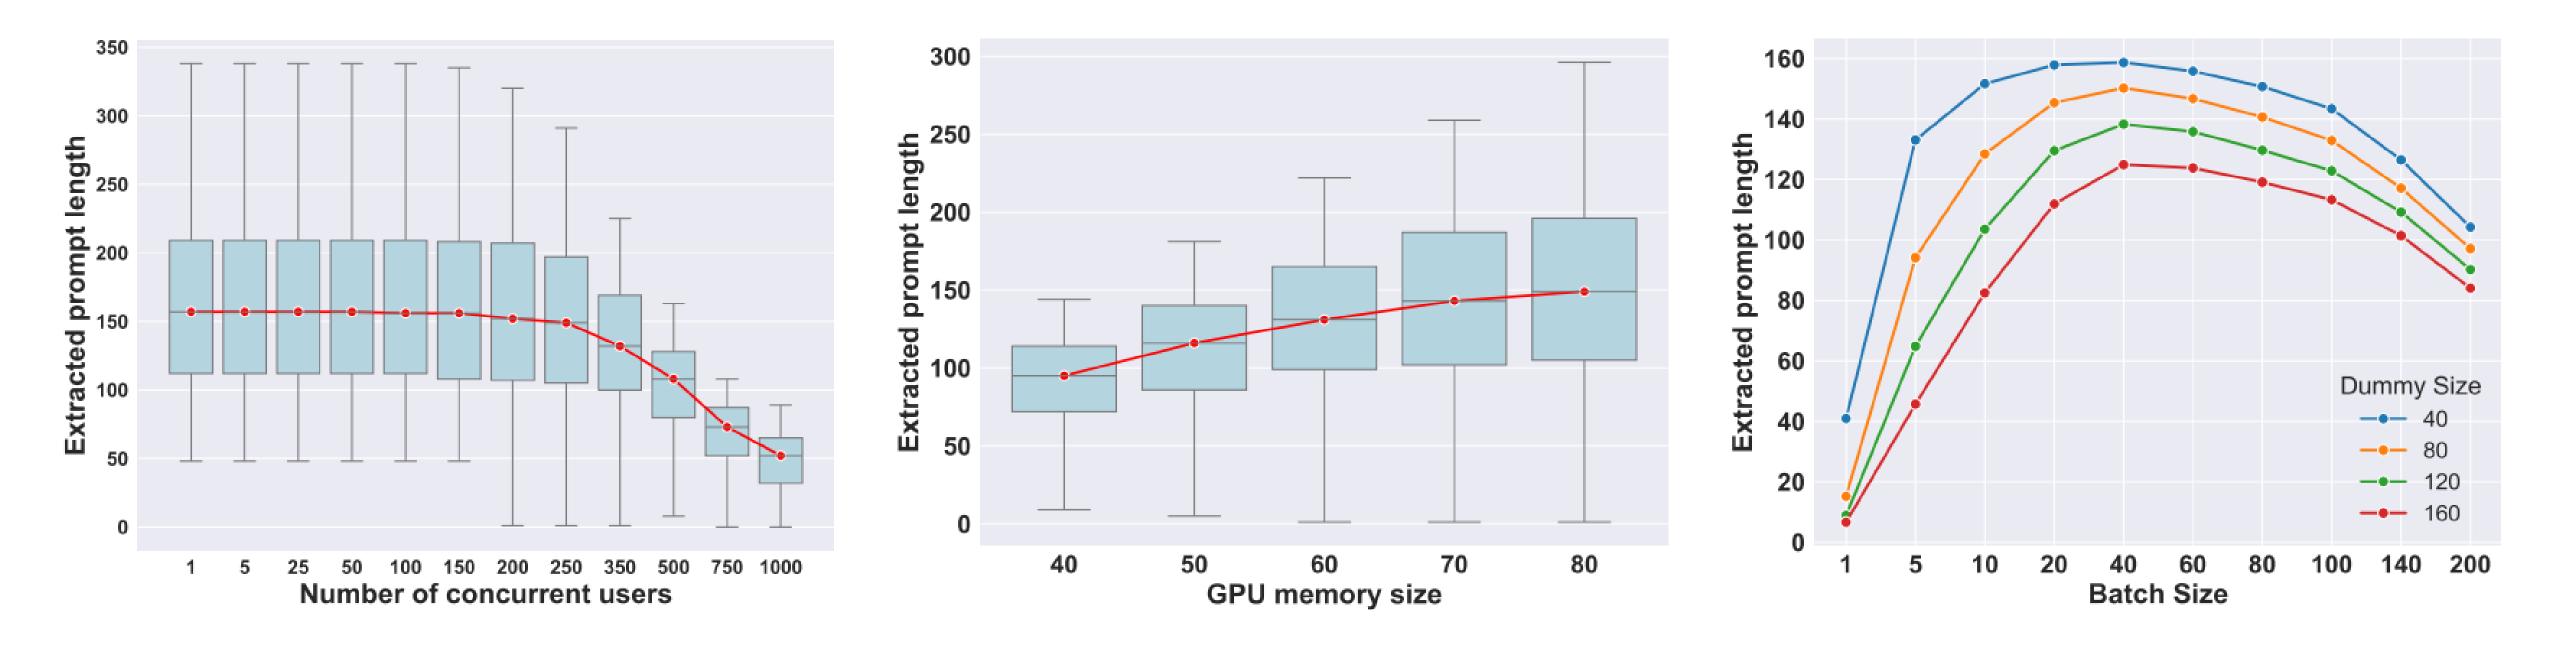

Evaluation Setup

- LLM server configuration: Llama2-13B, Llama3-8B-GQA
- User configuration: 40 requests every 3 hours per user (OpenAI)
- Four datasets: ultrachat, PromptBase, awesome-chatgpt, alpacca
- Three scenarios: whole prompt reconstruction, input reconstruction, template reconstruction
- Two research questions:
 - How effective is the attack?
 - How much cost of the attack?

How effective is the attack?

Three decisive factors: memory capacity, concurrent users' requests, attack strategy

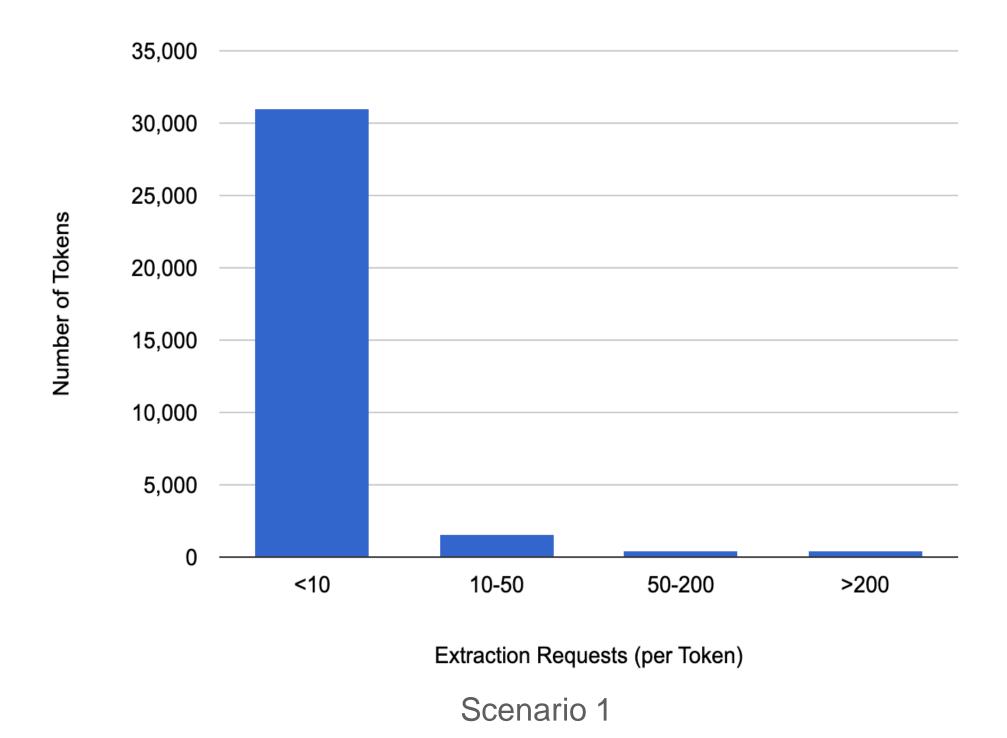

How much cost of the attack?

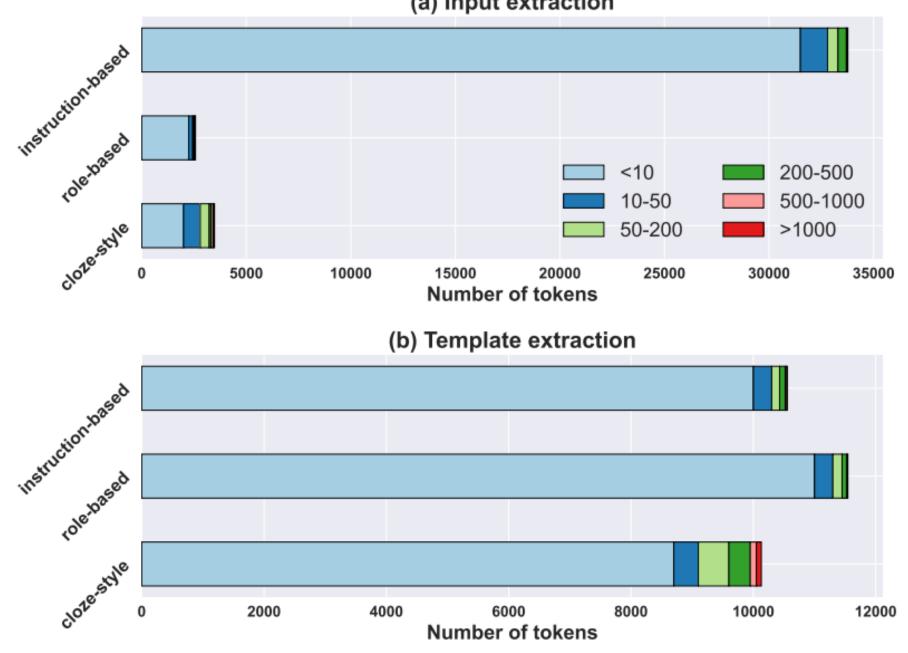

Most tokens can be reversed with less than 10 guesses

More evaluation on all three scenarios can be found in our paper

(a) Input extraction

Scenario 2 & Scenario 3

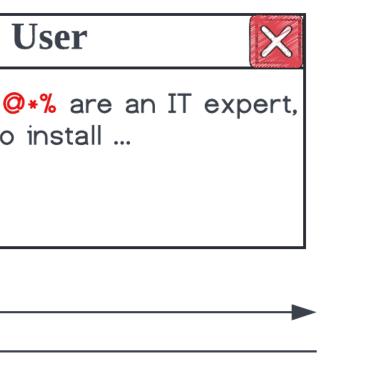

Countermeasures

- Prioritizing requests with multiple matched tokens instead of one, which significantly raises attack cost while preserving performance.
- Adding rare tokens to the prompt to disrupt the token-by-token attack

Imagine you (tell me how to
